Subject: Evidence of forward head movement presented by Liebler
I would like to inform the board that some evidence presented to it by Mr. Liebler was based on erroneous measurements of the Zapruder film. This mistake has been often repeated and though I may not be able to make the case for the correct way to measure (although I believe I do know how), I think I can easily make a case that there were considerations not taken into account in the measurements presented that would significantly affect them. What should I do?--Dave
