I INTRODUCTION (U)

This study is an overview of psychoenergetics research efforts in those Free-World countries that have published articles in the open literature. The data are restricted to foreign work and are derived from a comprehensive survey of eight major parapsychological journals, spanning a period from 1972 until the present. Two hundred and thirty-three articles were evaluated and computerized in a Data Base Management System (DBMS) according to six major topics or keywords and 16 subtopics that were chosen specifically to reflect those areas considered to be of principal interest

The six principal topic headings may be understood in general terms according to the following set of definitions:

- Remote Sensing: The acquisition and description, by mental means, of information blocked from ordinary perception by distance or shielding, and generally believed to be secure against such access.*
- Remote Action: The production of physical effects, such as the perturbation of instrumentation or equipment that appears to be well shielded against, or otherwise inaccessible to, human influence.*
- Reliability/Screening: Spans a wide range of prescriptive, methodological experiments or experimental protocols; also includes studies involved in the identification of correlates (e.g., physiological, psychological, and so forth) that may enhance psychoenergetic functioning and/or facilitate the selection of talented subjects.
- Theoretical Models: Various paradigms and plausibility arguments, which have been advanced within physics and other disciplines that endeavor to explain observed phenomena.
- Healing: The ability of an agent to cure illness or to influence positively the physical state of a biological system.

* (U) H. E. Puthoff, R. Targ, and E. C. May, "Psychoenergetic Research: Suggested Approaches," SRI White Paper, SRI International, Menlo Park, CA (1 May 1978), SRI Proprietary.

- Miscellaneous: Encompasses all topics that were determined to possess little or no immediate interest (e.g., "hauntings," detection of the human aura, and so forth).

(U) Table 1 provides a summary listing of the Free-World countries (and their respective research facilities) that have published articles in the open literature for a given topic. This table should be examined with the attendant caveats that (1) no evaluation of the quality of any published research was undertaken for the purposes of this study and (2) a given article may have been counted more than once if it had been determined that its principal research objectives encompassed more than one major topic.

(U) By way of summation, the following observations may be derived from a general analysis of Table 1, and by further utilizing the sub-keyword capabilities of the DBMS:

- England and The Netherlands published equivalent numbers of articles on the topic of "remote sensing," followed by West Germany. The following represents a distribution of articles according to remote sensing subtopics (Table 2).
- The Netherlands, West Germany, and Scotland, respectively, are indicated as performing the majority of the research in "remote action." The distribution of interest with regard to the sub-topics within this major category is as follows (Table 3).
- The Netherlands, England, and Scotland, respectively, represent the primary investigators of techniques both for enhancing the reliability of psychoenergetic functioning and/or for identifying talented subjects. Within the major category of reliability and screening, the published articles for these three countries may be further subdivided into the following distribution of specific subtopics (Table 4).
- West Germany and England, followed by The Netherlands and Scotland, respectively, have advanced the greatest number of published theories and models. These may be further delineated according to the following subtopics (Table 5).
- Very little work has been published on "healing" in this particular selection of journals; this is not to conclude that this kind of research categorically is not occurring, but that it may be published elsewhere in a different genre of periodical.

II METHODOLOGY (U)

A. (U) Article Selection Criteria

(U) The articles that were selected for this study were not subjected to any devised set of qualitative criteria, because it was not possible (within the scope of this report) to provide in-depth evaluations for each of 233 separate publications. A somewhat primitive screening procedure for methodological quality was achieved by reviewing only those journals that are typically refereed, or those that are generally regarded by the parapsychological community at large as publishers of serious state-of-the-art research.*

(U) As a result, there were only two criteria that had to have been fulfilled for an article to be included in the DBMS survey. First, the article had to have been published in one of the following journals:

- European Journal of Parapsychology
- Journal of Parapsychology
- Journal of the American Society for Psychical Research
- Journal of the Society for Psychical Research
- Psychoenergetic Systems: An International Journal
- Psychoenergetics: The Journal of Psychophysical Systems
- Research Letter
- Research in Parapsychology.

* (U) A similar review of the open literature on random number generator (RNG) psychokinesis was provided in a 1980 SRI International report entitled "Electronic System Perturbation Techniques." In that study, many of the same journals listed in this report were surveyed, and it was determined that the articles exhibited a wide spectrum of methodological quality, ranging from exemplary, to poor or nonexistent. A similar caveat must be borne in mind, therefore, with regard to the quality of the articles that were surveyed for this report.

UNCLASSIFIED

(U) Second, the article had to have indicated the foreign facility at which the published research was performed, in order for the article to have been counted as "foreign." The reason for this criterion, of course, is that American parapsychologists publish in foreign journals, and foreign parapsychologists publish in American journals; an accurate assessment of foreign work, therefore, cannot be obtained by simply surveying the foreign journals. The advantage of this procedure is that, for this study, U.S. publications could be reliably excluded from the data base. The disadvantage was that valid foreign research was also rejected from the data base--if the facility at which the research was performed was not listed in the article.

B. (U) Keyword System Development

The computerized article keywording system was developed specifically to address those topics deemed to be of primary interest. The keywords, themselves, were chosen to reflect the principal areas in psychoenergetics, as determined from previous studies. By applying this set of keywords, then, to the Free-World data base, a primary overview of Free-World facilities involved in similar or commensurate research. As has been mentioned previously, it was not within the scope of this document to evaluate the efficacy of all of the research efforts in the Free-World countries but merely to highlight the principal Free-World facilities that are researching those areas in psychoenergetics that are of primary interest.

C. (U) Keyword System Application

(U) For the purposes of this study, the articles were sorted according to (1) the six major keyword headings, only, for the presentation of data pertaining to all countries (cf, Section 3, "Data" below); and (2) further subtopic classifications for a chosen subset of the Free-World countries (cf, Section I, "Introduction" above). Table 6 provides the operative definitions for the major keywords and their respective subtopics.

In addition to query capability on subtopics within a given major topic, combinations of major and subtopic keywords may be utilized across topics to satisfy relatively specific query requirements. For example, a keyword combination of "Remote Action," "Micro," "Reliability/Screening," and "Physiological Correlates" would typically select out articles from the data base that dealt with experiments in random-number generator psychokinesis, during which aspects of the subject's physiological state (e.g., galvanic skin response) were monitored.

(U) In conclusion, there are three principal advantages to the current design of the keywording system in particular, and the DBMS in general, in that they allow (1) continual expansion of data and modes of data classification; (2) "horizontal" surveying capability across, for example, many countries or topics; and (3) "vertical" in-depth surveying capability through increasingly finer topic discriminators.

Table 6

(U) OPERATIVE DEFINITIONS OF MAJOR KEYWORDS

Major Keyword	Subtopic Keyword
<p><u>Remote Sensing</u>--The acquisition and description, by mental means, of information blocked from ordinary perception by distance or shielding, and generally believed to be secure against such access</p>	<p>Precognition: acquisition of information about an event prior to the occurrence of the event</p> <p>Altered States: psi modalities in the Ganzfeld, lucid dreams, hypnosis, and so forth</p> <p>Dowsing or biophysical effort (BPE)</p> <p>Remote viewing (RV)</p>
<p><u>Remote Action</u>--The production of physical effects, such as the perturbation of instrumentation or equipment that appears to be well shielded against, or otherwise inaccessible to, human influence</p>	<p>Micro: interactive effects produced at the molecular or atomic levels</p> <p>Macro: effects or perturbations typically observable without the aid of instrumentation</p> <p>Biological: production of measurable changes of state in biological systems</p>
<p><u>Reliability/Screening</u>--Spans a wide range of prescriptive, methodological experiments or experimental protocols; also includes studies involved in the identification of correlates that may enhance psychoenergetic functioning and/or facilitate the selection of talented subjects</p>	<p>Methodology</p> <p>Physiological Correlates</p> <p>Psychological Correlates</p> <p>Perceptual Correlates</p> <p>Physical Correlates</p>
<p><u>Theoretical Models</u>--Various paradigms and plausibility arguments advanced within physics and other disciplines that endeavor to explain observed phenomena</p>	<p>Mathematical/Physical</p> <p>Psychological</p> <p>Philosophical</p> <p>Physiological</p>
<p><u>Healing</u>--The ability of an agent to cure illness or to positively influence the physical state of a biological system</p>	<p>No subtopics as yet implemented</p>

III DATA (U)

(U) This section has been included primarily for reference use, in the event that more specific information is required concerning article titles, facilities, authors, and so forth. Appendix A is a list of authors and article titles according to a sorted hierarchy, by country, topic, and facility within a given country, respectively. It should be noted that an article will be listed twice under a given country and topic, if it has, in fact, been published in more than one journal. Appendix B provides a bibliography for all principal authors of articles included in this survey.
